Republic of Iceland

People

Population	278,702 (December 1, 1999)
Capital.....	Reykjavík, population 109,184 (December 1, 1999)
Language	Icelandic; belongs to the Nordic group of Germanic languages
Religion	Evangelical Lutheran (95%)
Life expectancy	Females: 81 years , Males: 76 years

Governmental System

Government	Constitutional republic
Suffrage	Universal, over 18 years of age; proportional representation
Legislature	Alþingi with 63 members
Election term	Four years, last election May 8th 1999

Economy

Monetary unit	Króna (plural: krónur); currency code: ISK
Gross domestic product.....	631 billion krónur (US\$ 8.7 billion) in 1999
International trade.....	Exports 35% and imports 38% of GDP in 1999
Per capita GDP	2.3 million krónur (US\$ 31 thousand) in 1999

Land

Geographic size	103,000 km ² (39,768 mi ²)
Highest point	2,119 m (6,952 ft)
Exclusive economic zone	200 nautical miles (758,000 km ² \ 292,680 mi ²)
Climate	Cool temperate oceanic; highly changeable, influenced by the warm Gulf Stream and Arctic currents

1. The Republic of Iceland

Iceland was settled late in the 9th century. The majority of the settlers were of Norse origin, although a certain element of the early settlers was of Celtic origin. A general legislative and judicial assembly, *Alþingi*, was established in 930 and a uniform code of laws for the entire country was adopted at the same time. In 1262, Iceland entered a treaty that established a union with the Norwegian monarchy. When the Danish and Norwegian monarchies were united in 1380, Iceland came under a Danish rule that lasted for more than five hundred years. Iceland was granted a new constitution in 1874 and obtained home rule in 1904. With the Act of Union in 1918, Iceland became a sovereign state in a monarchical union with Denmark. In 1944 Iceland terminated its monarchical union with Denmark and founded a Republic.

Geography and population

Iceland is located in the North Atlantic between Norway, Scotland and Greenland. Iceland is the second largest island in Europe and the third largest in the Atlantic Ocean with a land area of some 103 thousand square kilometres and an exclusive 200 nautical mile economic zone extending over 758 thousand square kilometres in the surrounding waters. Iceland enjoys a warmer climate than its northerly location would indicate because a part of the Gulf Stream flows around the south

and west coast of the country. In *Reykjavík*, the capital, average temperature in July is around 11 degrees centigrade and just below zero degrees centigrade in January.

Being of volcanic origin, Iceland consists of coastal lowlands and a mountainous interior with several glaciers, the highest of which is 2,119 meters high. The coasts are rocky and of irregular outline, with numerous fjords and inlets, except for the south where there are sandy beaches with no natural harbours. Most of the arable land, estimated to be around 20 percent of total land area, is situated along the coast and most of the population lives in the coastal regions.

Iceland is one of the least densely populated countries in Europe with only 2.6 inhabitants per square kilometre. The population of Iceland was 279 thousand at the end of 1999. The annual rate of population growth was 0.95 percent between 1989-1999. Approximately 62 percent of the population live in the capital city of *Reykjavík* and its surrounding towns. The largest town outside the capital area is *Akureyri*, in the north, with a population of 15 thousand.

The native language, Icelandic, belongs to the Nordic group of the Germanic languages. The standard of education is high, and public education is compulsory between the age of six to sixteen. Command of English and the Scandinavian languages is widespread.

Political structure and external relations

The present constitution was adopted on June 17, 1944 when the Republic was established. Iceland has a parliamentary system of government. The legislative power is vested in the Parliament, *Alþingi*, and the executive power in a cabinet headed by the prime minister. The government must be supported by a majority of the Parliament to remain in power. The 63 members of the Parliament are elected from eight constituencies on the basis of proportional representation for a term of four years. A parliamentary bill becomes a law when it is passed by the Parliament and signed by the President. The President is the head of state and is elected for a term of four years by a direct vote of the electorate.

Iceland has a tradition of political stability. Since gaining autonomy from Denmark in 1918, governments have normally been formed by a coalition of two or more political parties. Currently there is an Independence Party/Progressive Party coalition Government with a majority in the Parliament. The results of the election in 1999 were as follows: The Independence Party obtained 40.7 percent of votes and 26 seats, the Progressive Party 18.4 percent and 12 seats, Social Alliance 25.8 percent and 17 seats, Left-Green Movement 9.1 and 6 seats, Liberal party 4.2 and 2 seats. Others obtained 0.8 percent and no seats. The next general election is due in the year 2003.

Iceland has participated actively in international cooperation. Iceland belongs to the group of Nordic countries that includes Denmark, Sweden, Norway and Finland as well as Greenland and the Faeroe Islands. The Nordic nations have established a wide-ranging co-operation in a variety of fields, including economic affairs and international representation. Iceland is a member of the Nordic Council and specialised institutions such as the Nordic Investment Bank. Iceland became a

member of the United Nations in 1946 and is an active participant in most of its affiliated agencies. Iceland is a founding member of the Bretton Woods institutions, the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (World Bank), both established in 1945. Iceland is one of the original members of the Organisation for Economic Co-operation and Development (OECD). It joined the Council of Europe in 1950 and has participated in the Organisation for Security and Co-operation in Europe since it was initiated in Europe in 1975.

Iceland became, in 1964, a contracting party to the General Agreement on Tariffs and Trade that became the World Trade Organisation (WTO). Iceland joined the European Free Trade Association in 1970 and entered into a free-trade agreement with the European Community (in 1972). In May 1992, the member countries of EFTA and the EU signed an agreement to establish a free-trade zone, the European Economic Area (EEA), which came to effect in January 1, 1994.

Iceland is a founding member of the North Atlantic Treaty Organisation established in 1949. A defence treaty with the United States was concluded in 1951. A NATO military base, staffed by United States military personnel, is operated at *Keflavík* in the Southwest of Iceland.

Social services

The health-care system is a crucial part of Iceland's extensive system of social protection which has developed for more than 100 years. The first old-age-pension legislation was passed in 1890, partly to replace poor relief that had been available from local communities for centuries. The first comprehensive social-insurance legislation was enacted in 1936. Following enhancement in recent de-

cares, health and social security represented approximately 47 percent of total government spending in 1998.

All residents of Iceland are covered by public health insurance as provided for in the 1993 Act on Social Security. Approximately 87 percent of total medical billings are paid by the public purse. While hospital treatment is free, patients face co-payments for most ambulatory care as well as for pharmaceuticals. The delivery of care is rather decentralised in local communities participating through a system of municipal health boards, but the role of central

government in the planning and co-ordination function is strong. In 1990, primary health care was further centralised, with the central government taking over complete financial responsibility in this domain, but a return of some functions, for example nursing-home care, to the municipalities is currently being contemplated. Ambulatory care is provided in outpatient clinics in major hospitals and by privately practising specialists. Primary health care is mainly provided by a network of some 70 public health centres, supplemented by private general practitioners.

2. Recent Economic Developments and Prospects

The Icelandic economy was still growing briskly in 1999. Growth has been led by private consumption and exports. Investment did not increase from the previous year. Inflation pressures were being felt while unemployment practically disappeared. To prevent “overheating” of the economy the Central Bank raised its interest rates three times in 1999. The current account balance is still negative and terms of trade have deteriorated because of rising oil prices *inter alia*. The prospects for economic progress in the year 2000 are favourable overall although economic growth is likely to slow down.

Growth and trade

The economy has grown by five percent or more for four consecutive years. The National Economic Institute (NEI) estimates a 1999 growth rate of gross domestic product (GDP) to be 5.0 percent. For the period 2000-2003 economic growth is forecast to average around 2.5 percent per year. This is similar to the forecast for other OECD countries. In Figure 2.1 annual rate of economic growth in Iceland and OECD is shown.

Economic growth in the year 1998 was driven by an expansion in gross fixed investment and private consumption while exports and public consumption grew slowly. In 1999 exports are expected to grow by 6.9 percent and investment will slow down by -1.1%. Im-

ports grew by an estimated 6.0 percent in 1999 instead of 22.1 percent over the previous year in 1998. Export of services continued to grow briskly. A record number of tourists visited Iceland in the summer of 1999.

Catches of cod in the first nine months of 1999 increased by 6 percent over the same period in 1998 while total fish catch was almost 5% higher in tons. The cod quota for the fishing year September 1999 to September 2000 will be 3,000 tons below the 250,000 tons allocated for 1998-1999. Prices of marine products have fallen in 1999 after a substantial rise in 1998. The long-term outlook for an increase in marine export prices is favourable as the supply conditions of demersal fish have deteriorated world-wide. Cod quotas, for example, in the Barent sea and EU waters will be sharply reduced for the year 2000. Fish meal and oil are, however, subject to price competition from substitute products such as soya oil. The prices of aluminium and ferrosilicon which suffered in 1998 partly due to the Asian crisis have been slowly recovering. Terms of trade for goods and services improved by around 4.2 percent in 1998 but a deterioration of -1.1 percent is estimated for 1999.

The balance of payments

Import of goods will exceed export of goods by around 21 billion krónur in 1999 compared

Table 2.1. **Output and expenditure 1999**

Billion krónur	Volume changes percent	
	1999	98/99
Private consumption	400	7.0

Current transfers, net	-0	-
Current account balance	-38	-

Source: National Economic Institute; December 1999 estimation.

to 25 billion in 1998. The value of merchandise imports is estimated to increase by 1.1 percent and the value of merchandise exports

by 9.6 percent in 1999. Export of services will increase by around 5.5 percent but import by 6.6 percent making the balance of services negative by close to one billion. For 1999 the National Economic Institute expects the current account to be negative by 31 billion krónur or 4.9 percent of GDP while in 1998 the deficit was 5.7 percent of GDP.

Prices and wages

The rate of inflation in the course of the year 1999 was somewhat higher than anticipated by Central Bank. The Consumers Price Index (CPI) rose by 5.8 percent from January 1999 to January 2000. This implies an increase of around 3.4 percent between the annual averages of 1998 and 1999. The main factors contributing to the rise in the CPI are increased housing prices, increase in the cost of auto insurance and higher fuel prices. Real disposable income continued to rise in 1999 by an estimated five percent over the previous year. The real exchange rate of the króna appreciated by 2.8 percent during 1999 and was 4.4 per-

Figure 2.1

Source: National Economic Institute.

Figure 2.2

The current account in 1990-2000

Source: National Economic Institute.

cent above the central rate at the end of 1999.

This rise in inflation despite the strength of the króna is a warning signal. The Central Bank forecasts lowering of the inflation rate next year or a 3.7 percent rise in the CPI. Much depends on a new wage settlement to be negotiated early in the year 2000. Realistic increases in wages in combination with tight monetary and fiscal policy should help to preserve the price stability attained in recent years.

Unemployment continues its declining trend. The unemployment rate declined in 1998 to 2.8 percent of the labour force and an unemployment rate of only 2.0 percent is has been achieved in 1999. This is the lowest unemployment rate among the OECD countries. Employees in specific groups with particular educational background and skills are in short supply such as computer experts and business administration graduates. Foreign labour has increasingly helped to relive labour shortages especially in the fishing industry around the country.

Outlook for the year 2000

Economic growth is expected to slow down to 2.9 percent in the year 2000. The main reason is more modest growth of private consumption and lower export growth than in 1999. The current account is not expected to improve much although terms of trade should improve slightly (around 1%). The investment boom has slowed down and a modest growth of around 2.1 percent is expected in the year 2000 mostly due to investment in fishing vessels, increased housing construction and expansion of the Aluminium smelter at *Grundartangi*. Inflation is expected to be lower than this year or 3.7%. Unemployment is expected to be around 2 percent as in 1999.

Monetary policy

The main task of monetary policy has been, in the recent period, to restrain demand and combat growing inflationary pressures. In addition, credit expansion and private sector financing through foreign borrowing has been of some concern.

The yield in the domestic money market has been substantially higher than trade-weighted foreign money market rates abroad. The difference was over three percentage points in the last three months of 1998, it climbed to over five percent after an interest rate increase in September 1999 and is around 5.5 percent at the beginning of 2000. Long-term interest rates in the secondary market fell during 1998 but short term lending rates of commercial banks rose in 1999. Monetary aggregates have been growing rapidly. Broad Money (M3 including accrued interest) rose 14 percent in 1998 and in the first eleven months of 1999 broad money grew by over 17 percent. Credit is expanding much faster than total deposits. In the light of these developments monetary policy will continue to be restrictive. In February 1999 the key short-term Central Bank rate, the repo rate, was raised to 7.9 percent and liquidity requirements were introduced on financial institutions. In June the repo rate was increased to 8.4 percent and in September to 9.0 percent. Despite these meas-

ures, the instrument rates of the Central Bank at the beginning of 2000 were somewhat lower in real terms than a year ago.

In January 2000 the repo rate was increased by 0.8 percent to 9.8 percent and in February by 0.3 percent to 10.1 percent. At the same time the fluctuation band of the exchange rate of the króna from the central rate was increased from ± 6 percent to ± 9 percent.

Public finance

Treasury finances for 1999 are looking even rosier than expected and privatisation receipts in the fourth quarter have led to a very favourable Treasury cash flow. The budget for 2000 was passed in December with a surplus of around 2% of GDP.

The parliament passed the traditional supplementary budget for the current year as well as next year's budget before retiring for the holidays. There were dramatic changes to plans for 1999 with core revenues, - taxes, interest, dividends and license fees, - being projected 8.7 percent higher than in the origi-

nal 1999 budget, mainly due to higher growth in wages and consumer spending than expected. Total revenues are up a significantly higher 12.5 percent, the difference being largely attributable to a boost revenues from stepped-up privatisation.

Spending plans were also revised drastically. Total expenditure plans were revised upwards by 5.7 percent and core-expenditures, - excluding interest payments, imputed pension rights of public employees and investment,- are up by 6.1 percent. The most significant increases are in health expenditures, mainly due to generous new wage contracts. There is also a significant boost in fixed investment.

The outlook is now for a 15 billion krónur. budget surplus for the year as a whole or 4 billion krónur. not counting privatisation profits. This compares with a surplus of 2.4 billion krónur. with and deficit of 1.3 billion krónur. without privatisation profits built into the 1999 budget.

The budget for the year 2000 was passed in December with a surplus of 16.7 billion with privatisation profits and 12.5 billion without. The rise in core expenditures is forecast at 4.4 percent while core revenues are expected to grow by 4.5 percent. However, sharp drops in investment expenditures, interest payments and imputed pension liabilities cut the growth of total expenditures to 0.2 percent. Thus, looking at fundamental revenues and expenditures, the consolidation of treasury finances, which has been ongoing throughout the nineties as manifest in the accompanying figure, seems set to weaken this year. Two caveats must be added: First, the outlook for the year is relatively unclear, as most wage contracts will be renegotiated during the next twelve months. Second, revenue estimates of the 2000 budget seem on the modest side given revenue estimates for 1999 and the general

economic outlook for 2000.

Because of large chunks of privatisation receipts,- an estimated 16 billion krónur. or 2.5 percent of GDP in 1999 falling to 6½ billion krónur. in the budget for 2000, and with the government lending to the housing system continuing to be replaced by ordinary market financing, the Treasury net borrowing requirement is estimated negative, in actual surplus-by some 3.6 percent of GDP in 1999 and 3 percent of GDP in 2000.

With deficits turning into surpluses, treasury debt is falling even faster than suggested by the treasury's surplus. This is because standard debt measures do not include imputed pension liabilities, even if the rise of these liabilities counts as a expenditure. The fall in Treasury debt is estimated at 9 billion krónur. in 1999 and 18 billion in 2000, while net Treasury debt should fall by around 20 billion krónur in each of these years. Gross Treasury debt should fall from 40 percent of GDP at the end of 1998 to around 30 percent by the end of 2000, while net debt will fall from around 25 percent to 15 percent in the same period. It must be kept in mind, however, that a significant part of the improvement comes from privatisation revenues.

Local government finances remain a concern. It is now clear that local governments ran a deficit of 4.5 billion krónur. in 1998. This constitutes around 0.8 percent of GDP and 7.8 percent of total local government revenues. There is no indication that this situation improved in 1999. Local governments have been pressing for more leeway to raise taxes. While local government income taxes will be largely unchanged in 2000, a rise in real estate prices will boost the revenue of at least some communities. Local government debt will rise from around 7.2 of GDP in 1998 to around 7.8 percent by the end of 2000 in spite of growth in the economy.

Privatisation

The sale of the remaining 51 percent of the total equity of FBA - The Icelandic Investment Bank (*Fjárfestingarbanki atvinnulífsins*) was completed in November 1999. The new shareholders are a variety of individual, corporate and institutional investors. Further privatisation of public enterprises, especially those that compete with private sector enterprises, is on the agenda of the government. Two state-

owned commercial banks, *Landsbanki Íslands* and *Búnaðarbanki Íslands*, were incorporated in 1998 and the banks issued new equity for sale to the public later in the year. These changes are a first step towards the full privatisation of these institutions. Full privatisation, however, requires special approval by the parliament. The Government sold 15 percent of its stake in these banks to the public in December 1999.

3. The Structure of the Economy

Disadvantages resulting from the relatively small size of the population have not emerged as a hindrance to economic growth and prosperity in Iceland. Living standards are among the highest in the world. The economy, which was based on fisheries and agriculture at the beginning of this century, has diversified into manufacturing and service industries in the last decades. Important primary and secondary industries are based on the use of renewable natural resources, namely the coastal fishing banks, hydroelectric power and geothermal power. Also Iceland has ample resources of

cold water that is excellent for human consumption as well as industrial use. Tertiary activities employ around two thirds of the manpower and significant new developments have taken place in activities based on investment in human capital such as software production, financial activities and biotechnology.

The estimated contribution of the various industrial sectors to the total GDP in 1998 is shown in table 3.1.

Fishing and fish processing

The marine sector, including fishing and fish processing, is the main export sector. In 1998, 73 percent of merchandise exports (about half of total exports) originated in this sector. In the early 1960s, exports of fish and fish products constituted over 90 percent of merchandise exports.

The principal part of the Icelandic marine sector is the stock of groundfish, including species such as cod, haddock, saithe, and redfish. The catch of groundfish reached a maximum of 716 thousand tons in 1981 but declined soon after that. In 1999 the catch of demersal species is estimated to be around 546 thousand tons. Conservation measures led to substantial cuts in cod quotas in early 1990s, cod being the single most valuable species in Icelandic waters. The fishing industry offset the cuts by increasing catches in other marine species and by fishing beyond Iceland's exclu-

Table 3.1. **Share of GDP by industry 1998**

Source: National Economic Institute

sive 200 mile fishing zone. More efficiency has been achieved by selective catches, fish landed by foreign vessels has increased and a larger share of the catch has been processed domestically. In the last couple of years the cod stock has been recovering. Apart from groundfish and shrimp, the most important fish for Iceland's marine sector is capelin, a small fish of the salmon family. The capelin catch in 1998 was 750 thousand tons down from 1319 in 1997. The National Economic Institute estimates that the total catch will be 800 thousand tons in 1999. The catches of shrimp, lobster and shellfish have been of substantial value in recent years as well as catches of herring, which used to be one of the most important fish in the sixties. The production of fishmeal and oil has been very changeable. Well over half of export value is frozen fish but fish on ice and salted fish are also important processing methods.

A comprehensive fisheries management policy has been developed to manage the fish stocks. Quotas regulate catches of all the major

species of fish. The total allowable catch is determined on the basis of biological estimates of the status of the fish stocks and forecasts for their development in the near future. This quantity is then allocated among individual fishing vessels and the quotas can be traded between companies at market price. The fishing quotas were originally allocated, free of charge, to fishing vessels on the basis of fishing experience as measured by the average catch for the last three years before the first allocation in 1986. A substantial market for fishing quotas has developed since 1990.

The fish processing industry increasingly relies on computers, electronics and modern management techniques, as well as research and development in biotechnology. The production systems are flexible and it is relatively easy to divert the raw material to the most profitable processing method whether it is freezing, salting or drying. The technologically advanced fishing fleet includes vessels that can perform high-quality processing at sea. The number of companies in this sector has

declined but average size increased in recent years due to several corporate mergers, but alongside this developments the number of small private boats that operate close to the shore has greatly increased in recent years as well as their share of the total catch.

Increased quality and diversification extends not only to processing, but also to marketing. Icelandic fish products have been actively marketed in the United States, Europe and Japan and Icelandic products have acquired widely established brand names. Progress in the marine industry has to a certain extent limited the risks associated with Iceland's dependence on export of marine products as is evident by rapid adjustment to the loss of markets in Japan and elsewhere because of the recent Asian crisis. Icelandic firms have also been buying established businesses in fish processing and distribution in various countries.

Manufacturing and power intensive industries

The largest manufacturing industries in Iceland are based on the extensive use of electric power and produce for export. Various small scale manufacturing units produce for domestic consumption mainly although an increasing number is producing for exports also. In 1998, manufactured products accounted for approximately 22 percent of total merchandise exports.

The development of power intensive industries is based mainly on competitive energy prices that can be found in Iceland. The Government has been encouraging investment from foreign enterprises to develop such industries. Production of aluminium and ferrosilicon contributed approximately 1.4 percent to GDP in 1998. The largest manufacturing facility in Iceland is an aluminium smelter located at *Straumsvík* near *Reykjavík*. The smelter is owned and operated by the Icelandic Alum-

inium Company Ltd, ISAL, a wholly owned subsidiary of Alusuisse Lonza AG of Switzerland. A 60,000-ton expansion of the *Straumsvík* smelter was completed in September 1997 bringing total capacity to 162,000 tons per year. Nordic Aluminium which is owned by the US company Columbia Ventures, completed the building the first phase of a new 60,000 tons aluminium smelter at *Grundartangi* in June 1998 and is preparing to double the capacity in the next two or three years. The Icelandic Government, Elkem A/S of Norway and the Sumitomo Corporation of Japan jointly own a 72,500 ton ferrosilicon plant, Icelandic Alloys Ltd, *Járnblendifélagið*, at *Grundartangi* in *Hvalfjörður* on the west coast of Iceland.

Four medium-sized manufacturing enterprises, a fertiliser plant, a cement plant, a rock wool plant and a seaweed meal plant use locally available raw materials to produce for export (rock wool, seaweed meal) and the domestic market. The products of other manufacturing industries include fishing gear, packaging for exports, building components, machinery, equipment repair and maintenance, soap and related chemical products, plastics, ceramics, food products, beer, liquor, soft drinks, paint and furniture.

Geothermal steam has been used successfully in a diatomite plant in northern Iceland. Geothermal steam is available in several other places and can be of potential use in many industries as well as in the production of electricity.

In recent years, there has been a brisk growth of various high-technology industries such as pharmaceuticals, computer software industry and biotechnology. These industries are first and foremost based on investment in human capital. Production of equipment and electronic appliances for fishing and fish processing has also developed successfully. This development is supported by specialised

knowledge and experience obtained from fisheries and fish processing.

Agriculture

Approximately one-fifth of the total land area of Iceland is suitable for fodder production and the raising of livestock. Around six percent of this area is under cultivation, with the remainder devoted to raising livestock or left undeveloped. Production of meat, dairy products and eggs is mainly for domestic consumption. The principal crops are hay and potatoes. Vegetables, flowers and even some fruits are cultivated in greenhouses heated with geothermal water and steam. A fur industry has developed and knitted clothing made of Icelandic wool is a popular export item.

The agricultural sector has undergone structural changes in recent years. Demand for traditional products, especially lamb and mutton, has declined substantially while consumption of pork and poultry has risen in line with increased productivity and efficiency, especially in the production of pork. Price support and

export subsidies for the traditional products, sheep and milk, have been replaced with subsidies in the form of direct income payments to the farmers. In the agricultural fiscal year from October 1997 to October 1998, these direct payments are estimated to amount to 42 percent of the farmers' costs in raising lamb and to 40 percent of the costs in milk production. Subsidies to farmers amounted to about 1.5 percent of GDP in 1998. Imports of meat, dairy products and vegetables that compete with domestic production are subject to high tariffs, controls to prevent diseases and seasonal quotas. Imports are likely to increase as tariffs go down in line with the WTO agreement on trade in agricultural products.

Energy

Iceland has extensive hydro and geothermal resources. Electric power potential from hydro and geothermal sources is estimated to be at 50.000 GWh per annum, taking economic and environmental considerations into account. In 1998, the use of electricity in Iceland was

approximately 6,300 GWh per year meaning that less than 15 percent of the power potential, as estimated by the National Energy Authority, has been harnessed. Furthermore per capita consumption of energy is close to being the highest in the world. A new 120 MW hydropower station, *Sultartangavirkjun* was completed in 1999.

All towns and villages and virtually all farms are connected to the public power utilities. All the largest hydroelectric power plants as well as the inter-regional power lines are owned and operated by the National Power Company, *Landsvirkjun*, which is the prime supplier of electricity in Iceland. The State owns 50 percent of the company, the City of *Reykjavik* owns 45 percent and the Township of *Akureyri* owns 5 percent of the company.

Hot water from geothermal sources and natural steam is extensively used for residential heating and cultivation in greenhouses. Approximately 85 percent of all households are heated with geothermal energy. In industry, geothermal heat is mainly used for the drying of seaweed and for the production of diatomite and salt.

Almost all of the electricity consumed is produced from indigenous energy resources, hydro and geothermal energy. Oil is only used to meet peak demand and as a reserve resource. Imported oil is used mainly in transportation, for the fishing and commercial fleets and the industrial production of fish meal and fish oil. Oil imports (fuels and lubricants) accounted for around 5 percent of the total value of merchandise imports in 1998, as compared to 19.3 percent in 1979 when oil prices were exceptionally high.

Transport and communications

The domestic transportation network consists of roads, air transportation and coastal shipping. Car ownership is widespread. Iceland had 434 passenger cars per 1,000 inhabitants in

1994 as compared to the United States that had 565 and Denmark 312. Several airlines operate in Iceland. Icelandair, *Flugleiðir*, is a private company with international routes and direct flights from Iceland to a number of cities in Europe and the United States. Air Atlanta mainly operates as charter airline on international routes outside Iceland. Some foreign airlines also operate routes to Iceland with maximum activity during the summer. The domestic market is dominated by two private airlines namely *Flugfélag Íslands* that is owned by Icelandair and *Íslandsflug*. Both airlines run routes between several towns and villages around the country and the former also runs routes to Greenland and the Faro Islands.

Iceland has numerous harbours that are almost without exception free of ice throughout the year. In exceptionally cold years, drift ice from Greenland can close harbours in the northern part of the country. The three main shipping companies, *Eimskip*, *Samskip* and *Nesskip*, operate regular shipping routes to the major ports of Europe and the United States.

In January 1998 the Post and Telecom Iceland was divided into two separate entities, Iceland Post and Telecom Iceland. The telephone and telegraph system, operated by Telecom Iceland, is both extensive and modern, with satellite earth stations, optical fibre cables, and an extensive cellular mobile phone system. Iceland Post and Telecom Iceland are limited liability companies owned by the Icelandic State. A private firm, *Tal hf*, started to operate in 1998 offering GSM services in competition with Telecom Iceland.

The Public Broadcasting System, *Ríkisútvarp*, operates two radio channels and one television channel, covering virtually the whole country. *Íslenska útvarpsfélagið* is a private company that operates two television channels and two radio channels. In addition, there are several private radio stations and a few local television stations.

The labour force

In 1998 the total Icelandic labour force was estimated to be 135,021 man-years. The overall participation rate has increased considerably in the last decade, primarily due to increased participation of women. In Iceland, approximately 82 percent of the population between the age of 16 and 74 belong to the labour force. Women accounted for 43 percent of the total estimated labour force in 1998. The participation rate for both the elderly and the young is relatively high compared with neighbouring countries. In August 1999 unemployment was 1.7 percent of the labour force as measured in man-years, 1,610 females and 802 males. The working week in Iceland is considerably longer than in other OECD countries. Early retirement is rather uncommon, retirement age is between 65 and 70.

Most Icelandic employees are members of trade unions. The majority of the larger trade unions of private sector employees are affiliated with the Federation of Labour. Most of the trade unions of public sector employees are affiliated either with the Federation of

Public Employees or the Federation of University Graduates

Service industries

The tourism sector has been one of the fastest growing industries in recent years. Foreign visitors in 1998 numbered 232 thousand, compared to 129 thousand in 1987. The foreign exchange revenues generated by tourism in 1998 amounted to approximately 12 percent of the total foreign exchange revenues of the economy. Whale watching is an example of a new tourist activity that has been growing rapidly in recent years. Conditions for whale watching in Iceland are among the best in the world.

Many important structural changes have been implemented in the financial sector in the last decade. Among these are interest rate liberalisation, elimination of automatic access to the Central Bank facilities by the Treasury, liberalisation of foreign exchange regulations and establishment of foreign exchange market. Also the establishment of a stock exchange, the development of secondary markets for public and private bonds. Liberalisation of invisible transactions, long-term capital movements and cross-border financial services, as well as the development of various new financial instruments. The Banks and specialised financial institutions are capable of offering a full range of financial services needed by enterprises whether they are producing for the domestic market or foreign markets. In addition to financial services there has been rapid growth of other business services including computer services and software development.

The environment

Compared to other industrial countries, Iceland is relatively unpolluted and faces few immediate environmental problems. Electricity and geothermal heating, Iceland's main energy sources, are generated by the use of renewable

Table 3.2. **Percentage breakdown of employment by industries**

resources. Utilisation of hydro power, however, requires the building of dams and large reservoirs that can affect the landscape. The acid disposition over Iceland is very low, due to Iceland's geographic location and the limited emissions of pollutants. Emission of greenhouse gases from Iceland in the year 2000 are predicted to be 15 percent higher than in the year 1990. If emissions from new power intensive industries are excluded, emissions in the year 2000 will not exceed the 1990 level. The

emission limit set for Iceland in the Kyoto Protocol for the period 2008-2012 amounts to a 10 percent increase from the 1990 levels. The largest emittant is the fishing fleet, then the transport sector and thirdly various industrial processes. The marine environment around Iceland is believed to be relatively unpolluted. Soil erosion is still a problem especially in areas used for sheep raising. Considerable work is being carried out to regain badly eroded land.

4. Foreign Trade

The foreign trade of Iceland is characterised by a relatively high ratio of trade to gross national product, a high ratio of primary exports, concentration in export production, geographical concentration of export markets and limited intra-industry trade and specialisation. These are trade characteristics that can generally be found in small economies.

Iceland imports a wide range of manufactures, raw materials and food stuffs. The great variety of imports needed results from the small size of the economy, limited manpower and a limited range of natural resources.

In table 4.1 imports and exports by main economic categories are shown.

The growth of the export sector largely determines the rate of growth of the economy as a whole. Imports and exports of goods and non-factor services averaged 67 percent of GDP during the period 1990 to 1997. Growth of exports averaged 3.0 percent per annum during this period and imports grew by 2.8 percent while GDP grew by 2.0 percent. From 1945 to 1997 exports grew by 4.6 percent per annum on the average while GDP grew by 4.0 percent.

Figure 4.1

Growth of real export income and gross national income

Source: National Economic Institute.

In figure 4.1 the relationship between the growth of gross national income and real export income since 1975 is shown.

Real export income is calculated by dividing the index of export income by the index of import prices. Real export income is a proxy for the buying power of exports and reflects in some cases better the development of the export sector than volume indices, especially when the volume of exports is very volatile, in the case of Iceland, due to large swings in fish catch. The growth trend of real export income averages 2.8 percent per annum. Periods of slow growth were often due to reduced fish catches or fall in prices of marine products. Promising new export products that are being developed in fisheries equipment, pharmaceuticals, software and biochemistry should help to stabilise export earnings.

Growth of export in services, especially tourism, has been rapid in the last decade. Growth of services has helped to diversify the export industries and made the economy less vulnerable to supply and demand condi-

tions in the marine industry. Revenues from the export of non-factor services account for close to one third of Iceland's total export earnings. Service income has risen considerably in recent years, mainly due to a substantial increase in tourism.

Free international trade is of paramount importance to Iceland. The dilemma faced by the small economy is that to obtain some economies of scale in production the country must specialise in few export items in which the country has a comparative advantage but at the same time this specialisation makes it more vulnerable to external market instabilities. Iceland has increasingly supported and participated in international efforts aimed at freer trade both at the regional and international level.

Iceland made a free-trade agreement with the European Union in 1972, under which tariffs on most industrial products were removed. Under the agreement on the European Economic Area (EEA) between EFTA and EU, effective January 1, 1994, Iceland and other EFTA countries generally participate in

the free cross border movement of capital, labour, goods, and services within the EEA. Certain provisions are subject to implementing legislation in Iceland and elsewhere. A free trade agreement is being negotiated between the EFTA countries and Canada.

Tariffs in Iceland on most industrial products have been greatly reduced as a result of EEA, EFTA and WTO membership. Only certain agricultural products are still subject to high tariffs but they will be gradually lowered in accordance with the WTO agreement on trade in agricultural products. Tariffs and import levies on general imports and cars constitute between 4 and 5 percent of Treasury income.

In 1998 over two thirds of merchandise exports went to the countries within the European Economic Area and almost two thirds of imports originated in the EEA. Currently, Iceland's largest trading partners are the United Kingdom, Germany, the United States, and the Nordic countries (Denmark, Finland, Sweden and Norway) as is shown in figure 4.3. Iceland has traditionally had a trade surplus with Japan (except in 1998), UK and the United States, but a large deficit against the other Nordic countries.

In Figure 4.4 changes in terms of trade over a long period are shown. Terms of trade were highly unstable when merchandise exports were mostly fish products but in recent years the terms of trade have become more stable. This increased stability reflects increased diversification in the export industries but more stable import prices especially oil prices have also contributed to this trend.

5. Monetary and Exchange Rate Policy

The main monetary policy objective is price stability. A stable exchange rate is the intermediate target of monetary policy. The Central Bank is responsible for implementing monetary policy. The Central Bank mainly pursues its monetary policy by indirect means through market operations, primarily in the money market and the inter-bank market in foreign exchange. The main instrument used by the Central Bank is the repo rate.

The Functions of the Central Bank

The Central Bank of Iceland, *Seðlabanki Íslands*, was established in 1961. The Board of Directors (consultative) is elected by the Parliament for a term of four years. The Prime Minister appoints the Governors of the Bank. The Central Bank of Iceland performs all traditional central banking functions. Through market operations, the Central Bank conducts monetary policy consistent with the goal of maintaining low inflation. The exchange rate policy is formulated jointly by the Central Bank and the Government. The Central Bank holds and manages the nation's foreign exchange reserves. Moreover, the Central Bank acts as the borrowing agent for the Republic of Iceland in international capital markets.

The Treasury and several government institutions have bank accounts with the Central Bank, which acts as banker, economic

adviser and fiscal agent for the Government.

The Central Bank sets its own interest rates independently but the use of some of its instruments is subject to ministerial consent, the most important being the reserve requirement. The Central Bank offers lending facilities to credit institutions and sets reserve requirements. Financial institutions are free to set all their interest rates, with the exception that the Central Bank decides penalty interest rates on overdue payments.

In the first half of 1998 the Central Bank of Iceland made significant changes to its monetary policy instruments, modelled on the decisions taken for the European Central Bank.

Money supply, M3	15.2	17.1

Source: The Central Bank of Iceland.

The main objective of the reform was twofold: First, to level the playing field of credit institutions in the domestic market and their access to the Central Bank facilities, and second, to create operating conditions for domestic credit institutions similar to those prevailing in the European Economic Area.

Iceland presently has a quota of SDR 117.6 million in the International Monetary Fund. Since 1962, the Central Bank has been a party to an agreement between the Nordic central banks which consists of an exchange of credit lines, allowing each of the banks to draw on the others on a short-term basis in times of temporary foreign reserve shortage. The current agreement is with the central banks of Denmark, Sweden and Norway. According to the agreement the Central Bank of Iceland can draw up to ECU 200 million. In addition, the Central Bank has access to committed inter-bank lines for a total amount of US\$275 million and uncommitted interbank lines with a number of international banks.

Monetary and exchange rate policy

A stable exchange rate is the intermediate target of the Central Bank's monetary policy. Market forces have direct influence on the determination of the exchange rate in the inter-bank market for foreign exchange, but the Central Bank is equipped to intervene in that market through market operations to affect the daily exchange rate of the króna. Since June 1999 the Central Bank has not intervened in the foreign exchange market.

The currency basket, shown in figure 5.1 is composed of 9 currencies, weighted in terms of the respective country's share in trade of goods and services. The basket is revised once a year based on the composition of the previous year's trade in goods and services. The present policy specifies a fluctuation band of ± 9 percent from a central rate. The Central Bank will use its instruments of monetary policy to keep the exchange rate within this range. In practice, the Central Bank has allowed the exchange rate to move within the band to the extent that it deems such movements consistent with its long-term goal of maintaining low inflation. At the end of 1999 the exchange rate was 4.4 percent above the central rate and had appreciated by 2.8 during the year.

Figure 5.1

The currency basket since the middle of 1999, based on 1998 trade figures

Source: Central Bank of Iceland.

The Central Bank imposes a reserve requirement on all credit institutions, at the present amounting to 1.5 or 4.0 percent of total disposable funds, depending on maturity.

In March 1999 the Central Bank set new liquidity requirements for credit institutions. Those rules were primarily prudential in nature aimed firstly to ensure that credit institutions have at all times enough liquidity to be able to meet their obligations and secondly to reduce the reliance of domestic credit institutions on foreign short term capital to finance their domestic lending activities which had risen sharply in late 1998 and at the beginning of 1999.

In the latter half of the year 1999 the Central Bank and Financial Supervisory Authority in collaboration with credit institutions developed new liquidity rules that became effective at the end of the year. These new liquidity rules are based on a completely new approach. Instead of setting a limit on specific liquid assets in relation to disposable funds, the new rules require a maturity analysis of both sides of the balance sheet, including off-balance sheet items, of credit institutions. The new rules demand that liquid claims on the asset side over the coming three months are equal to or exceed liquid claims on the liability side that might arise in the same period.

Capital movements

Rules and regulations governing inward and outward capital transactions in Iceland have been gradually liberalised. The final step in the liberalisation of external capital movements was taken on January 1, 1995, when all restric-

tions on short-term capital movements were abolished. The regime on external capital movements in Iceland is now in full accord with the EEA agreement and the regime in the EU countries. Foreign exchange conversions for current payments are unrestricted since a new Act on Foreign Exchange and the Regulation on Foreign Exchange became effective on January 1, 1993. Payments in connection with trade in goods and services are also fully liberalised.

Direct investments and purchases of residence abroad by Icelanders are fully liberalised. However, there are still restrictions on direct investments by foreigners in three sectors; fishing and fish processing, the energy sector, and aviation:

- Direct investments by non-residents in fishing and fish processing is prohibited, indirect investment is limited to a maximum of 33 percent.
- Investment in energy production and energy distribution in Iceland is allowed to residents and companies residing inside the EEA. Residents and companies residing outside the EEA can apply for such rights, by having such investment contracts approved by the parliament.
- Investments by residents outside the EEA in aviation companies are restricted to 49 percent.

Foreign borrowing by the Treasury and government institutions requires authorisation by the Parliament. These authorisations are listed in the annual budget approved by the Parliament. In addition, there is a standing authorisation to refinance outstanding public debt.

6. Financial Markets

Over the last decade the Icelandic financial system has undergone an important transition, generated by liberalisation and legislative reforms. The current Central Bank Act was adopted in 1986 and at the same time the final phase in the deregulation of interest rates was completed. In the mid-eighties the Iceland Stock Exchange was established, securities companies emerged and the first mutual funds were established. Towards the end of the decade a process of rationalisation in the banking sector took place through mergers. The BIS standard for rules on capital adequacy of commercial and saving banks became effective in the beginning of 1993. In connection with the agreement on the European Economic Area (EEA) a new legislation was enacted in 1993 based on EU financial directives. With this legislation stricter rules were adopted to ensure the economic health of banks and other financial institutions, including rules on a minimum capital ratio and exposure to risk. Bank supervision, now in the hands of the Financial Supervisory Authority, was also strengthened.

Credit institutions

There are four commercial banks in Iceland, two are majority owned by the government, *Landsbanki Íslands* and *Búnaðarbanki Íslands*, one is a fully private, *Íslandsbanki*, and one, *Sparisjóðabanki Íslands* (Icebank Ltd.), is

owned by the savings banks. Three of the four commercial banks perform all the traditional banking operations, accept deposits, grant credit, deal in foreign currencies and maintain accounts with correspondent banks abroad. *Landsbanki* and *Búnaðarbanki* were converted into limited liability companies as of the beginning of 1998. Initially the state was the sole owner, but there was an authorisation to sell new equity up to 35 percent of the current equity position. A public offering of 15 percent of new equity in *Landsbanki* came to market in September 1998. A similar offering of equity in the *Búnaðarbanki* came to the market in December 1998. The Icebank functions on behalf of the 29 savings banks as their banking institution. The savings banks are generally private institutions with local operations and they perform most traditional banking operations. In addition to commercial and savings banks there are two other types of deposit receiving institutions, namely the savings departments of the co-operatives and the Post Giro.

The new incorporated investment bank FBA - The Icelandic Investment Bank, created by a merger of four investment credit funds and initially fully owned by the government, has operated since the beginning of 1998. The bank has been fully privatised.

A new State Housing Fund started to

operate at the beginning of 1999 replacing the previous housing institution. The new fund is based on legislation, approved by the Parliament in June 1998, that is aimed at rationalising the existing state housing fund system.

The three leasing companies in operation have recently diversified their activities by granting loans in addition to making conventional leasing contracts.

The securities market

The securities market has expanded rapidly in recent years. Since 1964 the Government has issued indexed Government bonds, and in the 1980s a secondary market for these bonds began to develop. In recent years, there has been an increase in the variety and volume of financial instruments that the government, municipalities and financial institutions have offered on the market.

The bond market has continued to develop as well as money and equity markets. Two milestones in the development of the bond market were the introduction of the housing bond system in 1989, with tradable securi-

ties, and Government securities auctions where Treasury bills, Treasury notes and Government savings bonds have been offered in regular auctions since 1992. Marketable bonds and money market instruments were equivalent to 6 percent of GDP, but at the end of 1998 they amounted to over 60 percent of GDP.

The extensive practice of indexation of financial obligations in Iceland has been one of the main characteristics of the domestic financial market. Indexation was brought into the financial market during a period when Iceland suffered a high rate of inflation. The two-tier system of indexed and non-indexed obligations has tended to cause nominal interest rates to change in accordance with inflationary trends rather than as a reflection of changes in credit supply and demand. As price stability has taken firm hold, indexation is receding from the short end of the financial market.

The Iceland Stock Exchange was established in 1985 and now operates under new legislation adopted in 1998. The new act required the Icelandic Stock Exchange to be converted into a limited liability company (imple-

Table 6.1. **Selected market securities**

Source: The Central Bank of Iceland.

mented in 1999), abolished its monopoly on exchange activities but at the same time gave it increased room to grow and offer new services. Currently there are twenty members of the Exchange, including the Central Bank, all the commercial banks and securities houses and some savings banks. Among securities listed on the exchange are the stocks of around 70 companies, government bonds, notes and bills and various private bond issues, primarily by credit institutions. Listing on the Exchange is subject to listing requirements set by the Exchange, including disclosure requirements.

Turnover on the exchange has risen rapidly in recent years. At the end of 1998, the market capitalisation of listed securities was 633 billion krónur or seven percent above GDP. Of this sum 369 billion krónur were bonds, 232 billion krónur equities, and 32 billion krónur money market instruments. The largest brokers have operated a non-regulated over-the-counter (OTC) market for non-listed shares since 1992. The Stock Exchange allowed its members to utilise the Exchange's trading system for the trading in this market.

Institutional investors

Currently there are 65 pension funds in Iceland. Their number has decreased in recent years due to mergers. The pension funds receive payments from employers and employees and are the most important source of long-term finance in the country. The pension funds have traditionally invested in bonds issued by the Treasury, other financial institutions, municipalities and companies. They also extend credit to members. About 20 percent of their assets are in Icelandic and foreign equity and in mutual funds. In recent years the pension funds have started to invest in foreign securities.

In 1985 mutual funds were first established in Iceland. There are now eleven closed-end mutual funds in operation. They are limited liability companies, and nine of them are

quoted on the Iceland Stock Exchange. There are eight open-end mutual funds that are operated in 32 divisions. One credit institution also operates mutual funds quoted on the Luxembourg Stock Exchange.

There are now 15 insurance companies licensed to operate in Iceland. Three of them are life-insurance companies, representing only 4.5 percent of total assets of the companies. One reason for the relatively small share of life insurance can probably be traced to the employees' compulsory membership in pension funds. About half of the insurance companies' portfolio consists of marketable securities, which make them fairly sizeable investors in the Icelandic securities market. In addition, 126 foreign insurance companies have licenses to provide services in Iceland, of which two have established branches.

Supervision and regulations

The Bank Inspectorate of the Central Bank and the Insurance Supervisory Authority were merged into a separate entity, *Fjármálaeftirlitið*, the Financial Supervisory Authority (FSA), on 1 January 1999. The FSA has a Board of Directors appointed by the Minister of Commerce. The institution supervises commercial banks, savings banks and other credit institutions, insurance companies, companies and individuals acting as insurance brokers, undertakings engaged in securities services, mutual funds, management companies, stock exchanges and other regulated markets, central securities depositories (CSD) and pension funds. The Financial Supervisory Authority also supervises other activities which the institution has been authorised in accordance with special laws.

The main task of the Financial Supervisory Authority, is to ensure that the activities of the above institutions and firms are conducted in accordance with the relevant laws and regulations, and that they remain sound in

other respects. These institutions and firms are obligated to provide all the information considered necessary by the Financial Supervisory Authority to facilitate statutory supervision of their activities.

The Icelandic legislation and regulations regarding credit institutions and other financial institutions have been adapted to the various regulations and directives of the European Union as a consequence of Iceland's participation in the European Economic Area .

The current rules on capital adequacy for credit institutions and securities firms are based on the Basel guidelines and the EU capital adequacy directive, with a minimum capital ratio of 8 percent. According to rules that

the Central Bank has imposed, commercial and savings banks are limited in their foreign exchange exposure to 30 percent of equity as defined by the Capital Adequacy Rules (CAD) rules. The same applies to indexed assets and liabilities.

A deposit insurance schemes is in force. In recent years the commercial and savings banks have annually contributed 0.15 percent of their deposits to these funds. The present law stipulates that the insurance fund of the commercial banks is a government entity while the insurance fund of the savings banks is a private institution of which all savings banks are members.

7. Public Finance and Foreign Debt

A primary goal of policy makers has been to cut down government expenditures to eliminate the fiscal deficit. The fiscal deficits and public debt in Iceland have been well below the OECD average and Iceland has fully met the Maastricht criteria for general government finances since 1995. The financial balance of the general government in 1999 is now estimated to have been in surplus by around 1.4 percent of GDP. Estimates for the new year are for a surplus of around 1.8 percent of GDP. Preliminary estimates put total Treasury debt at 238 billion krónur at the end of 1998 and according to debt repayment plans, it should fall to around 230 billion by the end of 1999 and to around 210 billion by the end of 2000.

The size and nature of the Icelandic government sector

Compared to European countries, Iceland has a relatively small public sector, which has shrunk in recent years relative to GDP. Expenditures have fallen from a relatively steady 40 percent of GDP in the period 1988-1994 to an estimated 36.5 percent in 1998 while revenues have held steady between 36 and 37 percent of GDP. In relative terms from around 40 percent of GDP in 1990-1992 to an average 37 percent in 1996-1998. Revenues have held ground at around 37 percent of GDP. In this process a serious fiscal deficit has been corrected. During this period of declining expen-

ditures, government consumption has actually increased while current transfers have hardly budged. Subsidies and capital transfers have borne most of the decrease. The reduction in subsidies ties in with changes in agricultural support in the early 1990's while the reduction in capital transfers is concentrated in agriculture and housing. On the revenue side, there is a clear switch from indirect taxes on goods and services to direct taxes on income and wealth, the increase occurring mostly through broadening of the tax base rather than rate hikes.

Figure 7.1
Expenditure structure of
Central Government 1998

The most obvious reasons why the Icelandic government sector is smaller than those of European neighbours is a much smaller welfare sector than for example in the other Nordic countries. More precisely, expenditure on unemployment benefits are a significantly smaller percentage of GDP in Iceland than in the Nordic countries (0.7 percent of GDP vs. 3.4 percent unweighed average for other Nordic countries in 1996). The same goes for total pension payments, even if private sector pension funds are included (7.7 percent of GDP in Iceland vs 15.3 percent for other Nordic countries in 1996). Lower expenditure on unemployment is easily understood given the low unemployment rate and relatively low payments to each unemployed person. A younger population and a higher retirement age partially explain lower pension expenditures, while the rest is due to lower payments per recipient.

The division of responsibility

The local authorities are responsible for street construction and planning, for education from pre-school through the 10th grade, for welfare services of all kinds, in particular for the care for the disabled and elderly outside institutions, and for solving housing problems of those who cannot find housing on their own. In the area of welfare, local governments provide supplementary assistance to general programs of pensions otherwise run by central government. The centre, by contrast, is responsible for the police, courts and foreign service, higher education, health service, institutional care for the disabled and elderly and general support and services for industry. It administers basic old-age and disability pensions, means tested rebates on housing related interest payments and means tested benefits to families with children. By 1999 estimates total expenditures of local governments run around 10 percent of GDP as against a central government budget of 28 percent of GDP.

The budget process of the Central Government

The Icelandic Constitution requires the authorisation of the Parliament, *Alþingi*, for all central government expenditures, taxation and borrowing. The fiscal year coincides with the calendar year. The budget proposal for the coming year is presented to the Parliament at the beginning of each regular session in early October and usually passed by the third week of December. A supplementary budget bill is almost invariably introduced in the next fall session and a third bill accompanies the accounts of each year into the parliament. The use of supplementary appropriations has become more measured with the slowing of inflation in this decade. The central government's accounts are subject to audits and control by the General Auditor's Office, *Ríkisendurskoðun*, which is an independent entity under the Parliament.

Accounting standards

Fundamental changes were made to the presentation of the budget and the central government accounts in the beginning of 1998. There are three changes: First, the budget is now presented on accruals basis, containing authorisations to commit to expenditures. The government accounts have been based on accruals since 1965, but until 1998, the budget consisted of authorisations for payments. The difference between payments and accruals is quite significant at times for items such as interest on bullet bonds, increases in pension liabilities and write-offs of tax claims. Second, the budget now itemises grants for numerous activities which were previously off-budget but financed by levies set by law. Third, significant expenditures which were previously shown as subtracted from revenues are now shown explicitly as expenditures. These expenditure items include child benefits and housing bene-

fits as well as payments to the church and other established religious groups. These changes, which were put into effect with the 1998 budget, boosted the total budget numbers by 20 percent and treasury account totals by somewhat less.

The Tax system

The Central government, as represented by the Treasury, derives (in 1998) close to 90 percent of its revenue from taxes, of which roughly 27 percent comes from direct taxes on income and wealth and 63 percent come from indirect taxes.

A 26.4 percent tax is levied on personal incomes up to 3.3 million krónur, while higher incomes are charged an additional 7 percent. A tax credit of 280 thousand krónur per year implies that individual incomes are tax free up to annual income of around 1 million krónur or 15 thousand US dollars. For individuals with lower income, the tax credit applies towards a flat local government income tax which ranges from 11.24 to 12.04 percent, depending on municipality. Accordingly, individuals with income up to the equivalent of around ten thousand dollars per annum are exempt from general income taxes. The combined average rate of general and municipal income taxes has been reduced in steps from 42 percent in 1996 to 38.4 percent at the beginning of 1999.

Since 1990, the municipal income tax has risen from an average 7% to 11.96% in response to the abolition of a turnover-tax on businesses in 1993 and again to compensate for increasing responsibilities of local government in the area of primary education.

Interest, dividend and rental income of individuals, as well as capital gains up to 3 million krónur, are exempt from the general income tax and from municipal taxes, but are taxed at a lower rate of 10 percent.

A net wealth tax of 1.2 percent is assess-

ed to net assets above 3.8 million krónur for individuals.

Corporations pay a 30 percent tax on profits. This rate has come down from 50 percent in 1991. Capital income of corporations are treated like other revenue for tax purposes and corporations pay a 1.2 percent tax on net wealth.

A payroll tax of 5.23 percent is charged on wages, while certain basic or important industries pay 4.69 percent. The final step of a harmonisation process will implement a single rate of 5.14 percent by January 2000. Besides the tax, employers must also contribute at least 6 percent to a pension fund to match an employee contribution of at least 4 percent. Although membership is mandatory, and the operations of pension funds are regulated and their charters must be approved by the treasury, the funds are independently managed and considered independent of government.

The largest single source of treasury revenue is a value added tax, which is levied at

24.5 percent on most goods and services. Services of hotels and guesthouses, broadcasting services, newspapers, heating fuel and food-stuffs are taxed at 14 percent, while certain services, including health service and passenger transportation, are exempt.

Excise taxes were levied on a range of goods at three rates, while some goods are charged unit fees. The custom duty is in the range of 0-30 percent, but most imports from EFTA and EU countries are exempt from the duty. With the implementation of the EEA agreement as of January 1, 1994, all customs duties on manufactured goods, imported from countries that have implemented the EEA agreement, have been abolished. The revenue from excise taxes and import duties has fallen from around 1.5 percent and 3 percent of GDP in the early 1980's to around 0.5 and 0.4 percent in 1998.

There is a stamp duty on larger financial transactions as well as on most bank transactions. Taxes on the ownership of motor vehicles and excise taxes on gasoline make up between 7 and 8 percent of Treasury revenue, while between 4 and 5 percent is derived from charges on the sale of alcohol and tobacco.

The taxes described above accounted for close to 95 percent of Treasury tax revenue. Non-tax income accounts for just over 10 percent of treasury revenue and consists mostly of interest income, dividends, profits from sale of government assets and charges for services.

Local government finances.

At the beginning of 1999, Iceland was divided into 124 municipalities, of which 9 have population exceeding 5,000. The number of municipalities has decreased from 224 in 1980 due to mergers. In the same period, the municipalities have taken on increasing responsibilities, especially in the area of compulsory education, while in area of health care, some tasks have been handed over to central government. The

expenditures of local governments have expanded from around 6.5 percent of GDP in the early 1980's to 9.5 percent of GDP in the late 1990's, with increased education responsibilities accounting for more than 1 percent of GDP. The composition of local government expenditure is described in the accompanying chart.

The municipal income tax is the major source of local government revenue, accounting for 78 percent of total revenue in 1997, while real estate taxes account for an additional 17 percent. Income from local government enterprises and other property accounts for 6 percent and grants from the municipal equalisation fund for another 5 percent.

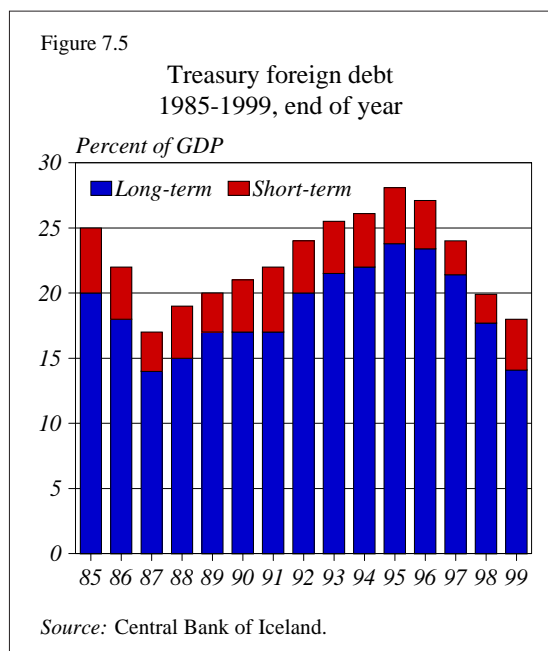

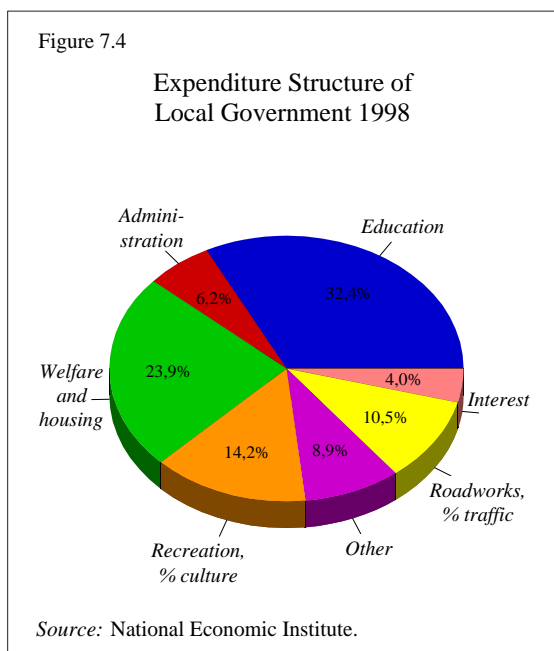

The finances of central and local government are interrelated in many ways. Many public services and investment projects are jointly financed. The intertwining of state and local income taxes was described in the section on the tax system. The municipal equalisation fund, which is jointly financed by the central and local government tax revenue, has the

obvious role of enhancing the revenues of weak municipalities with emphasis on education expenses and infrastructure investment.

In many instances, local government owns and operates major utilities. Waterworks and harbour facilities are almost invariably owned by the community, as are geothermal heating systems, where they exist. A few communities own their electricity distribution system, the rest being served by a state owned company. In the capital region, several communities are served by the heating and electricity distributor in Reykjavík, which thus serves almost 60 percent of the Icelandic population. Finally, the National Power Company, which produces 95 percent of total electricity in the country, and Iceland State Electricity, the main rural distributor of electricity, are government controlled.

Treasury foreign debt

The Republic of Iceland has been the largest and most active Icelandic borrower in international markets. In recent years, the surplus on

government finances has led to a reduction in the total outstanding foreign debt. The Treasury foreign debt to GDP ratio has fallen from 28 percent in 1995 to 20 percent in 1998 and a further fall is expected in 1999.

A primary aim in debt management is to spread the amortisation of foreign loans evenly over coming years as well as to achieve a favourable composition of the debt in regard to interest rates, maturity and currency denomination. In recent years prepayment options have been exercised in order to refinance debt on more favourable terms. Interest rate and currency swaps have also been used to achieve debt management objectives.

At end-1998, the Treasury's long-term foreign debt amounted to 104 billion krónur and the outstanding stock of euro-commercial papers stood at 13 billion krónur. Around 26.2 percent of the Treasury's foreign obligations were denominated in US dollars, 12 percent in Japanese yen and around 61.8 percent were denominated in the various European currencies. Around 38.5 percent were denominated in

currencies which were converted into the Euro at the beginning of 1999. The share of European currencies has risen and is now close to 62 percent. The share of the US dollar has declined, and is now just above 26 percent, in line with the increasing importance of trade with Europe. The share of the Japanese yen is now around 12 percent which is somewhat higher than the trade weight of the yen.

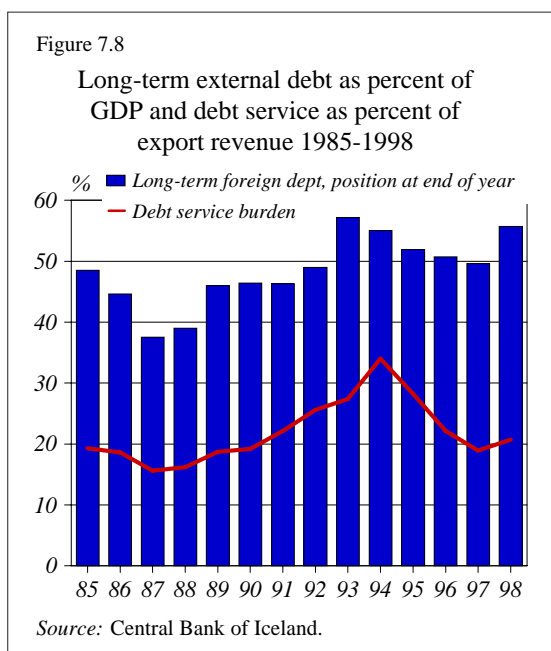

At end-1998, 60.8 percent of the Treasury's total foreign debt carried fixed interest rates. Of the long-term debt, 68 percent loans carried fixed rates of interest. The average maturity of the foreign long-term debt was 3.8 years and the average duration 2.7 years. Including the short-term debt, these numbers are 3.4 years and 2.4 years, respectively.

The Republic of Iceland Euro-Commercial Programme plays an important role in the foreign financing of the Republic. The size of the programme has been increased gradually from US\$ 50 million in 1985 to US\$ 500 million in 1995. The programme has been assigned the highest possible short-term rat-

ings of A-1+ by Standard & Poor's and P-1 by Moody's. The size of the programme is US\$ 500 million. A multi-currency option allows for issuance in alternate currencies. The paper is issued at a spread of approximately 10 basis points below LIBOR. Currently there are four dealers on the programme: Citibank International, SEB in London, JP Morgan and Deutsche Bank. Amount, maturity, and yield are negotiated at the time of issuance in view of market conditions.

In 1990, the Parliament enacted legislation to provide for the establishment of a national debt management agency, *Lánasýsla Ríkisins* (NDMA). The NDMA commenced operations in June 1990. Under this legislation, borrowing and debt management functions of the Treasury, both domestic and foreign, and government guarantees have been assigned to the NDMA. Under a special agreement with the Minister of Finance, the Central Bank is responsible for the execution of foreign borrowing for the Treasury.

National debt

Reported figures in the coverage of Icelandic foreign debt statistics include private as well as public debt, amounting to the total external debt of the economy. The net external debt of the Icelandic government, financial institutions and the private sector amounted to the equivalent of US\$ 4,1 billion in 1998, equivalent to 48 percent of GDP. This ratio peaked at 56 percent at the end of 1993. The fluctuations in the debt ratio do not only reflect changes in the volume of debt but also the volatility of exchange rates.

Debt service payments of long-term debt fluctuated between 14 to 24 percent of total export revenue in the 1980's. The debt service ratio peaked at 34 percent in 1994 but declined to 21 percent in 1998 but it is estimated to be still lower in 1999. The Republic of Iceland has always paid when due the full amount required in respect of principal, interest and sinking fund installments of all internal and external obligations.

Credit ratings

In 1996 and 1997 Moody's and Standard & Poor's upgraded Iceland's credit ratings to reflect the country's increased creditworthiness. Standard & Poor's announced in 1996 that it had upgraded the credit rating for the Republic of Iceland's long-term foreign currency denominated debt from A to A+, and short-term debt from A-1 to A-1+. Furthermore, Standard & Poor's assigned a first time rating of AA+ to Iceland's long-term local currency debt. In July 1997 Moody's upgraded the Republic's foreign currency rating to Aa3 and assigned Aaa rating to the Republic's long-term krónur bonds. In its press release announcing the rating upgrade Moody's made a reference to increased diversification in the Icelandic economy as a consequence of an influx new foreign investment projects that take account of the country's clear comparative

advantages such as abundant renewable geothermal and hydro energy and environmentally friendly tourism. Further, the improved ratings reflect the wide-spread restructuring and stabilisation of the Icelandic economy in the past years coupled with strong economic growth, low inflation, declining debt service and falling debt ratios.

In December 1999 Moody's and Standard & Poor's confirmed their previous ratings. Also Standard & Poor's announced a positive outlook on Iceland's long term foreign currency debt rating.

In February 2000 the international rating agency Fitch IBCA assigned a AA- long-term foreign currency rating for Iceland. A short-term rating of F1+ and an AAA for long term

local currency rating was also assigned. In its report Fitch IBCA said that long-term prospects for the Icelandic economy have improved in recent years, supported by progress with structural reform. A major fiscal consolidation programme in conjunction with funds raised from the accelerated privatisation programme have generated growing budget surpluses and enabled the authorities to start paying down the general government debt. The booming economy has, however, clearly overheated and Iceland's already high external debt ratios have worsened. Until tightened fiscal policy and interest rate rises of the Central Bank bear fruit, Iceland will remain vulnerable to changes in sentiment since liquid liabilities are well in excess of liquid assets.
